## Q1

Answer D
Explanation
$\sum F \propto t^{2}$ (Given) $\rightarrow \frac{\Delta v}{\Delta t} \propto t^{2}$
$v \propto t^{3}$
$v^{2} \propto t^{6}$
$E_{k} \propto v^{2}$
$E_{k} \propto t^{6}$

## Q3.

Answer D
Explanation
During light hours, algae carry out photosynthesis and release oxygen

## Q4.

Answer B

## Explanation

for $i$ : is true because the bold lines signify a separation of phases.
For ii: incorrect as lowering pressure does not change temperature
for iii: Correct as it is the triple point.
for iv: incorrect as the vapor pressure is equal to the atmospheric pressure (i.e. definition of boiling point)
Therefore, I and iii are the correct answers.

Q9.
Answer B
Explanation

$I_{1}=I_{2}+I_{3}$
$12.0=2.00 I_{3}+4.00 I_{1}$
$8.00=6.00 I_{2}-2.00 I_{3}$
Solving the equations 1,2,3 gives
$I_{2}=1.64 \mathrm{~A}$
$I_{3}=0.909 \mathrm{~A}$
$I_{1}=2.55 \mathrm{~A}$
The potential difference between points $c, d$
$\Delta V=2.00 \times I_{3}$
$\Delta V=1.82 \mathrm{~V}$
And point c with higher potential than point $d$

Q11.
Answer A
Explanation
In (I) the trait appears in the father may be dominant or recessive.
As the trait appears in females and not in males' children, therefore mother is not a carrier and the trait will not appear in females unless it is dominant

## Therefore, it is X-linked dominant

In (II) As the trait doesn't appear in both parents and appears in the only males of their kids, the mother carries the trait as recessive.
Therefore, it is X -linked recessive.

## Q15. <br> Answer B

Explanation
Step 1: is to write the balanced combustion reaction of methanol to yield $\mathrm{CO}_{2}$ and $\mathrm{H}_{2} \mathrm{O}$.
Therefore, $\Delta \mathrm{H}$ must be multiplied by 2 .
$2 \mathrm{CH}_{3} \mathrm{OH}+3 \mathrm{O}_{2} \rightarrow 2 \mathrm{CO}_{2}+4 \mathrm{H}_{2} \mathrm{O} \quad \Delta \mathrm{H}=(-726.4 \times 2)=-1452.8 \quad$ (1)
Step 2:

$$
\begin{aligned}
& \mathrm{C}+\mathrm{O}_{2} \rightarrow \mathrm{CO}_{2} \quad \Delta \mathrm{H}=-393.5 \\
& \mathrm{H}_{2}+1 / 2 \mathrm{O}_{2} \rightarrow \mathrm{H}_{2} \mathrm{O} \Delta \mathrm{H}=-285.8
\end{aligned}
$$

Step 3: Inverse equation (1)
$2 \mathrm{CO}_{z}+4 \mathrm{H}_{z} \mathrm{O} \quad \rightarrow 2 \mathrm{CH}_{3} \mathrm{OH}+3 \mathrm{O}_{2} \quad \Delta \mathrm{H}=+1452.8 \quad$ (4)
Step 4: Multiply equation (2) $\times 2$ and equation (3) $\times 4$
$2 \mathrm{C}+2 \mathrm{O}_{2} \rightarrow 2 \mathrm{CO}_{2} \quad \Delta \mathrm{H}=-787 \quad$ (5)
$4 \mathrm{H}_{2}+2 \mathrm{O}_{2} \rightarrow 4 \mathrm{H}_{2} \theta \Delta \mathrm{H}=-1143.2$ (6)
Step 5: By sum equations (4), (5) and (6)
$2 \mathrm{C}+4 \mathrm{H}_{2}+\mathrm{O}_{2} \rightarrow 2 \mathrm{CH}_{3} \mathrm{OH} \quad \Delta \mathrm{H}=-477.4$ (7)
Step 6: Divide (7) by 2
$\mathrm{C}+2 \mathrm{H}_{2}+1 / 2 \quad \mathrm{O}_{2} \rightarrow \mathrm{CH}_{3} \mathrm{OH} \quad \Delta \mathrm{H}=-238.7 \mathrm{KJ} / \mathrm{mol}$
OR:
Step 1: write a balanced reaction and reverse the reaction, reversing the $\Delta \mathrm{H}$ sign
$\mathrm{CH}_{3} \mathrm{OH}+3 / 2 \mathrm{O}_{2} \rightarrow 2 \mathrm{CO}_{2}+2 \mathrm{H}_{2} \mathrm{O} \quad \Delta \mathrm{H}=-726.4$
$\mathrm{CO}_{2}+2 \mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{CH}_{3} \mathrm{OH}+3 / 2 \mathrm{O}_{2} \Delta \mathrm{H}=+726.4$

## Q16.

## Answer A

## Explanation

At point F , the highest concentration is of HA and a slight (small) change in pH .
At point H , as KOH is added, HA is gradually converted to $\mathrm{A}^{-}$(buffering region), . Beyond point
$G$, the concentration of $A^{-}$is higher compared to HA.

## Q22.

Answer C

## Explanation

An exothermic process, by definition, involves a reaction in which the products are lower in energy than the reactants. The reduction in chemical energy results in a release of heat from the reaction.
In the diagram, the path between points is irrelevant. We are simply looking for any instances in which the product point is below the reactant point. Point L has less energy than point K , and point N has less energy than $\mathrm{K}, \mathrm{L}$, or M . Transitions from K to $\mathrm{L}, \mathrm{M}$ to N , or L to N will all result in a reduction of chemical energy, and a release of heat.
